**Function**

Electromagnets, relays, ignition coils, chocking coils und permanent magnets (e.g. hydraulic- or pneumatic valves) are characterized by stray fields of varying strength.

The JUNG MAGNET TESTER detects invisible magnet stray fields and determines the function or operating condition of these components.

The JUNG MAGNET TESTER detects magnet stray fields of alternating-current, direct-current and permanent magnets.

The JUNG MAGNET TESTER works with two commercially available batteries.

The tip of the JUNG MAGNET TESTER is equipped with a probe which reacts to the magnetic field and activates a lamp.

*The tests will be done during normal process without interruptions or engagements.*

The JUNG MAGNET TESTER is equipped with a ring magnet allowing easy checking of its working order.

By sliding the test magnet off the white cap and attaching it to the tip, a lamp is activated and the JUNG MAGNET TESTER can be used as a flash light for reading type plates, etc.

Robust components and durable materials contribute a long life-span and a long reliability.

The JUNG MAGNET TESTER is just slightly larger than a ball point pen and has an integral clip, permitting it to be carried in a coat pocket.

More Information you will find in the Operating Instructions sheet.

**TECHNICAL SPECIFICATIONS:**

Voltage: 3V DC

Battery ANSI: AAA (MICRO)

Colors: body = green, cap = white

This product agrees with the Directive 2004/108 EC and the standards EN 55014-01 und EN 55014-02 and is marked with CE.

**Manufacturing and Sales:**
